Diagnostic function

The **failure bands high** and **low** (FBH & FBL) are areas of the output signal into which the pressure transducer transitions in the event of an error and thus assumes a safe state. A control logic can thus detect faults in the sensor or the connecting line.

The pressure transducer has an output signal limitation upwards and downwards. This means that **pressures above the upper limit value** (V_{HCL}) and **below the lower limit value** (V_{LCL}) are output as a constant output signal according to the set values. Without limiting, the transducer would output up to the failure band limit in the event of overpressure or underpressure.

Ex works, the ranges of the failure bands and the signal limitation are set according specification (see "Technical data"). These can be adjusted at the customer's request.

The following diagnostic functions are available:

No.	GND	U_{V+}	U_{out}	Measured output	After wrong connection
1	nc	5 V	pull-down or pull-up	FBH	operational in specification
2	0 V	nc	pull-down or pull-up	FBL	operational in specification
3	0 V	5 V	nc	FBH	operational in specification
4	0 V	5 V	0 V	FBL	operational in specification
5	0 V	5 V	5 V	FBH	operational in specification
6	5 V	0 V	pull-down or pull-up		operational in specification
7 ¹⁾	0 V	18 V	pull-down or pull-up	FBH or FBL	operational in specification
8 ¹⁾	0 V	5 V	18 V	18 V	operational in specification
9	0 V	0 V	pull-down or pull-up	FBL	operational in specification

12 ²⁾	0 V	28 V			operational in specification
13 ²⁾	0 V	5 V	26 V		operational in specification
14	All short circuits and/or interruptions at the sensor measuring bridge lead to FBL				

¹⁾ Cases 7 and 8 must withstand 18 VDC for 2 h at 140°C.

²⁾ Cases 11, 12 and 13 must withstand 26 ... 28 VDC for 1 min at room temperature.
